SNAPSHOT OF PULSES IN INDIA

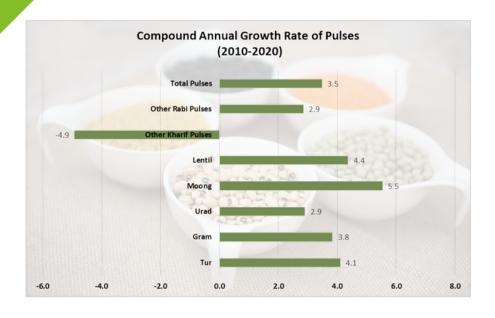

DISTRIBUTION OF TOTAL PULSES BY VARIETY

- The overall production of pulses increased from a level of 18.24 million tonnes to 25.72 million tonnes, with the compound annual growth of 3.5 percent in the last decade (2010-2020).
- Increase in production of Gram and Arhar, which account for 63% of the total pulses are the reason behind the overall rise in production of pulses. Madhya Pradesh, Rajasthan, Maharashtra and Uttar Pradesh are major producer of pulses

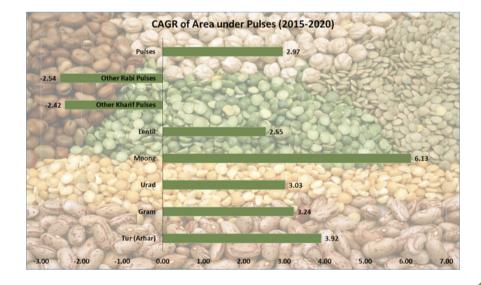

2021 | NOVEMBER Page 3 of 11

SNAPSHOT OF PULSES IN INDIA

 Moong Dal which accounts for 12 percent of total pulse production, has performed better than the other pulses with respect to production and area. In the previous decade (2010-2020), the production of moong increased by 1.29 million tonnes with the compound annual growth of 5.5%, significantly higher than that of total pulses (3.5%).

- Additionally, the overall area under cultivation of pulses increased by 3.92 million hectares with the CAGR of 2.97% (2015-2020). Among all the pulses, CARG for moong was highest at 6.13% in the same period. This impressive performance can be attributed to sustained increase in MSP.
- Madhya Pradesh has remained highest producers of pulses, despite fall in total area under cultivation in the last ten year. This is because of impressive increase in the yield levels from 656 kg per hectare to 1084 kg per hectare.

Value-Addition in Agricultural Commodities

By Aditi Chugh

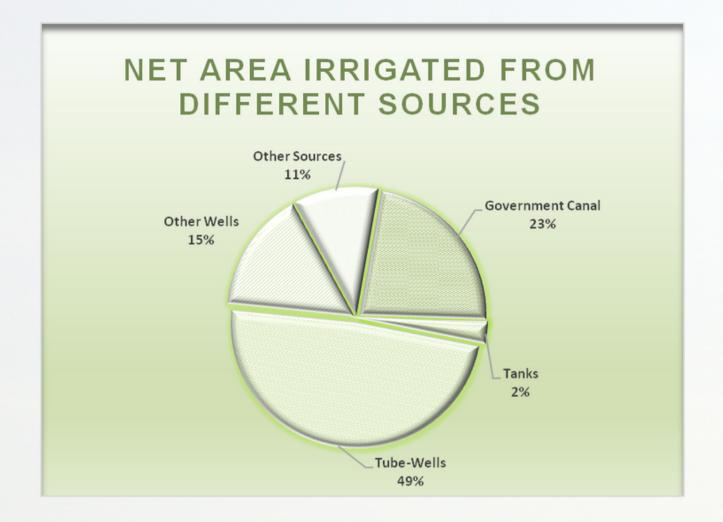

Value addition in agriculture refers to changes in various production or manufacturing processes, marketing or services that increase the value of primary agricultural commodities. There has been an increase in the demand for value added products due to rising incomes, increasing urbanisation, rapidly expanding markets, advances in technology and liberalized trade. On the other hand, farmers stand to significantly increase their income by adopting processing technologies that not only ensure better return on investment but also help in the managing risks associated with farming. On the economic front, the country benefits from moving up the value chain directly by increase in employment opportunities and growth in Gross Domestic Product and indirectly by improving the nutritional outcomes and overall wellbeing of its workforce.

In order to increase value addition from less than 10% to levels achieved by comparable economies like Brazil (almost 50%), Government has initiated many programs. In addition to the SAMPADA Yojana, Government has launched the Agriculture Infrastructure Fund of ₹ 1 lakh crore, Agri-Marketing Infrastructure Fund with a corpus of ₹2,000 crores,s and Agriculture Infrastructure and Development Cess targeted at post-harvest management and development and modernization of agricultural market infrastructure.

The two major factors that will immensely benefit the ongoing value-addition movement are the adoption of value-addition technologies by farmers and boosting demand for healthy food products through awareness generation. ICAR-CIPHET has developed many such technologies like manufacturing packaging material using banana leaves and deriving activated carbon from the walnut shell, which goes beyond the conventional value-added products derived from primary commodities and allows the farmers to monetize their by-products. A shift in consumer preference for nutri-food will make value-addition in agriculture not only possible but inevitable. Thus, interventions aimed at educating the population about ways to adopt a diversified diet that are both taste and pocket-friendly are essential for increasing the demand.

2021 | NOVEMBER Page 5 of 11

- Tube-wells is the most common irrigation method and accounts for 49% of net irrigation. Government canals (23%) are the second most popular source of irrigation.
- The total net irrigated area increased by 2% from 69.4 million hectares in 2017 to 71.4 million hectares in 2018.

FIXATION OF MINIMUM SUPPORT PRICE (MSP) OF TORIA

The MSP of Toria of Fair and Average Quality (FAQ) for 2021-22 has been fixed at Rs. 5050/- per quintal. It has been fixed on the basis of the normal market price differentials between Toria and Rapeseed/ Mustard

RELEVANCE AND DISTRIBUTION EFFICIENCY OF SEED MINIKITS IN PULSES IN BIHAR

-Agro-Economic Research Centre, Bhagalpur

OBJECTIVES

- To assess the relevance and the requirement of seed minikits among the farmers
- To compare the productivity of pulse crops using seed minikits with the control farmers/non-users, and;
- To suggest policy measures to address the efficiency issues in application/distribution of seed minikits

METHODOLOGY

The present study relied on both the primary and secondary data with reference period being 2018-19.

Primary data have been collected with a sample of 300 farmers comprising 200 beneficiaries and 100 non-beneficiaries/control farmers selected from 2 sample districts of Bihar viz., Patna (irrigated) & Muzaffarpur (dry land) on highest seed minikits distributed during the reference period of 2017-18/2018-19

FINDINGS

- Bihar produced 4.53 lakh tonnes of pulses and had about 4.79 lakh hectares of area under pulses in the reference period 2018-19.
- Area and production under total pulses in the state decreased by 18.93 percent and 4.36 percent respectively in TE 2016-17 over TE 2006-07.
- About 59 percent of the farmers received the information relating to the distribution of minikits from farmer facilitators,
- Major issues/ problems as perceived by the sample farmers were the distribution to Kith & Kin (81%), limited availability (40.5%), delay in reimbursement of the charged amount (22.5%), procedural complexities (22%), OTP relating hindrances (19%).

POLICY RECOMMENDATIONS

- Awareness should be created among farmers regarding core objectives of minikits for realizing
 maximum value of output by way of adopting optimal package of practices for growing and use of
 recent HYVs of pulse crops
- In place of any interested farmers, the distribution of seed minikits should be based on mapping of respective crop fields and identification of respective crop growers, following the mandated criteria, so that realization of the programme could be made with equity aspect
- A help desk for online registration on department's portal at block/tehsil level should be instituted to help the poor or needy farmers
- To ensure multiplication of seeds, field visits of the KVK Scientists are needed for extending field level advices to the beneficiary farmers along with capacity building of the field level staff.
- There is need to address the concerns raised by the beneficiary farmers about inadequacy. Kith & Kin approach of distribution, OTP hindrance, untimely distribution etc. should be avoided by proper monitoring of the concerned.

PROCUREMENT

As on 29 October 2021, during KMS 2021-22, Progressive Procurement of Rice was 86.36 lakh LMT as compared to 120.50 lakh MT procured during corresponding period of KMS 2020-21. About 7.69 Lakh farmers have been benefitted from ongoing KMS procurement.

Source: FCI

In the month of October, 2021, the wholesale prices of paddy, bajra, jowar, maize, ragi, safflower, and sunflower seed were ruling below their MSP.
